Your Theory of Change

The Impact Measurement Plan

Reflection Statement:

BioViL’s targets are deeply rooted in our vision of creating **self-reliant communities** where clean energy is a way of life. Constructing even a single biodigester by 2026 isn’t just about technology—it’s about proving that change is possible. When a dairy farmer partners with us to turn waste into cooking fuel, it sparks a ripple effect: families see cleaner air, forests breathe easier, and neighbors start asking, “Can we do this too?”

To track progress, we’ll focus on **stories and small wins**. For example, when a farmer signs a contract to host a biodigester, we’ll celebrate it as a milestone of trust. Workshops and learning programs won’t just be counted—they’ll be measured by the energy in the room: Are villagers getting excited while playing our Bioenergy Simulation Game and learning that this so-called waste is now can be utilized, while providing monetary returns? Are youth volunteering to lead the next session?

For stakeholders, these indicators matter differently:

- **Families** care about cooking without smoke and saving money.
- **Dairy farmers** want extra income from not buying firewood, or having to pay for the LPG connection, or selling the surplus biogas.

But the real success? **HOPE and SMILES**. Like the farmer in our pilot village who now introduces himself as a “bioenergy expert,” or his/her neighbour who buys the surplus at a rate cheaper than her current LPG connection. These moments remind us that sustainability isn’t a checklist—it’s a shared journey.

We’re new to this, but we’re learning fast: simplicity builds trust, and joy fuels change. Every biodigester built, every workshop held, is a step toward villages where clean energy isn’t a luxury—it’s just how life works.

Branding Story

What Inspired This?

Growing up in a rural Indian village, I watched my mother and neighbors rely on wood and dried biomass for cooking and heating. The smoke filled our homes, and forests slowly seemed less dense as firewood demand grew. After studying electrical engineering, I learned about biogas—a practical solution that converts organic waste (like cow dung) into clean energy. This connected two realities:

Abundance: Our community had ample animal and household waste.

Need: Families lacked access to clean, affordable energy.

"BioViL emerged from this practical insight: turning waste into a resource could address energy poverty and deforestation."

The Idea

BioViL empowers rural communities through a straightforward three-step approach:

Educate: Teach villagers how biogas works through hands-on workshops and demonstrations.

Aware: Highlight the health, economic, and environmental benefits of clean energy.

Implement: Build biogas systems (biodigesters) using local materials and knowledge, starting with dairy farmers.

"Our goal is to make bioenergy accessible and sustainable, ensuring communities lead their own energy transition."

Who Does This Impact?

BioViL serves rural Indian communities, particularly:

Farmers: Those with livestock who can convert daily waste into biogas.

Families: Reducing reliance on firewood improves health and saves time.

Youth: Trained as "BioEnergy Champions" to sustain and scale solutions locally.

"By focusing on these groups, we bridge the gap between waste abundance and energy scarcity."

Clean and Affordable
Energy

THE PROBLEM - WHY IT MATTERS

Over 700 million Indians rely on firewood for cooking, driving deforestation and indoor air pollution that claims 600,000 lives annually. In rural communities, families cook using firewood or dried dung, which harms their health and destroys forests. Many don't know there's a cleaner way. BioViL works to change this by turning everyday waste (like cow dung) into clean energy. We believe everyone deserves safe cooking and healthy working environments.

THE PEOPLE - WHO BENEFITS

We help villagers, especially farmers with cows, women cooking on smoky fires, and youth eager to lead. Together, they learn to turn waste into clean energy and protect their forests.

SOLUTION SPOTLIGHT

[Program]

We teach villagers to build biogas systems from waste, run workshops to spread awareness, and work with them to create lasting solutions. Simple tools, big change: cleaner homes, greener villages.

[Product]

BioViL provides locally built bio-digester systems that convert animal and household waste into clean cooking fuel. Starting with one village in 2026, we'll expand to more communities.

IMPACT - MAKING A DIFFERENCE

- Fewer families using firewood for cooking.
- More villagers leading biogas projects.
- Forests growing back as firewood use drops.

Measurement:

- Biodigester successfully constructed.
- Supplying the biogas to neighbouring houses.
- Tracking the before and after amount of firewood used by the farmer and villager

Milestone 3: Project Storyboard

Weaving all the
findings
together

BioViL's Theory of Change *“Turning Waste into HOPE”*

BioViL addresses the urgent need for clean cooking fuel in rural India, where families rely on firewood - harming their health and forests.

Our solution: **biodigesters** that convert animal and household waste into biogas. By 2026, we'll construct and operate the first biodigester in a pilot village, partnering with a dairy farmer to turn waste into clean energy.

Our Theory of Change is rooted in three steps:

Educate: Teach villagers through workshops, trainings, and gamification of the different topics related to bioenergy demonstrating how biogas replaces firewood.

Aware: Highlight biogas's benefits—cleaner air, reduced deforestation, and cost savings.

Implement: Build biodigesters and train communities to operate them, ensuring long-term adoption.

Success is tracked through tangible shifts:

- Bio-digesters installed and operating
- Farmers replace firewood with biogas for cooking.
- Monitor firewood reduction and forest regrowth.
- Community members become “BioEnergy Champions,” leading workshops and maintenance.

By 2030, we aim to scale to 10 villages, proving that clean energy can be both accessible and sustainable. Every biodigester built sparks a ripple effect: families breathe easier, forests recover, and communities gain pride in their role as environmental stewards. BioViL isn't just about technology—it's about empowering villages to choose health, sustainability, and hope.
